The MCP server tools one by one: list_models, generate_image, chat, web_search and others

MCP Server Created on **November 28, 2026** 3 min read

Once the MCP server is set up, the agent sees nine tools, with the description and fields of each one, and picks which one to use on its own. You do not need to call them by name. But knowing what each one does helps you ask better.

The ones that only read

Tool	What it does	Fields
`list_models`	Lists the models, with the id, the name and the price in credits.	`type` (`text` , `image` , `video` , `audio` or `agent`), `q` and `limit` , all optional
`get_model`	Shows the fields an image, video or voice model accepts.	`id`
`get_generation`	Shows the status of a generation and the links to the files.	`id`
`get_balance`	Shows the AI credits and, with a Coding Plan, the points left.	None

These four cost nothing. In ChatGPT they run at once, without asking for confirmation.

The ones that generate

Tool	What it does	Fields
`generate_image`	Generates an image from a description.	`prompt` and, if you want, `model` and `options`
`generate_video`	Generates a video from a description or from an image.	`prompt` and, if you want, `model` , `image_url` and `options`

Tool	What it does	Fields
`generate_audio`	Generates voice or sound from a text.	`text` or `prompt` and, if you want, `model` and `options`

Without `model`, we use a default model of ours, good and cheap. `options` holds the model's own fields, such as the image size or the video length. The agent sees them with `get_model`.

Each `generate_*` sends the request and waits up to about 50 seconds. If the generation finishes, it returns the links to the files and, for an image up to 1 MB, the image itself, which the agent can see. If it does not finish, it returns the id, and the agent checks it later with `get_generation`. The generation keeps running on the server and is charged when it finishes.

The links to the files are not permanent.
Ask the agent to download the files into the project.

chat: asking another model

`chat` asks a question to another text model or to one of your agents. The fields are `model`, `messages` or `prompt` and, if you want, `system` and `max_tokens`. Your agent keeps the model it already uses and asks another one for a second opinion, for example `deepseek-ai/deepseek-v4-flash`. Tokens are paid at the model price. With a Coding Plan, the plan models spend points.

web_search: searching the web

`web_search` takes a `query` and returns the top results, with the title, the link and a summary. Each search costs 0.5 credits. A search that fails costs nothing.

Permissions

With a key that only has `ai:read`, the agent sees the models, the generations and the balance, but cannot generate or chat. For everything, the key needs `ai:read` and `ai:write`. With your account, the authorization screen asks for both.

Before a long video or many images, ask the agent for the price, with `list_models`, and the balance, with `get_balance`. Example requests are in **asking the MCP server in plain language**.

RECOMMENDED

Want these tools in your coding agent? See the Coding with AI page.
