The minimum of 0.01 credits per request and how costs are rounded up

AI Credits & Costs Created on **November 28, 2026** 2 min read

Credits are counted with two decimal places. The cost of each request is rounded up to the nearest hundredth, and no charged request costs less than **0.01 credits**.

The example from the documentation

On a model at 56 credits per million input tokens and 112 per million output tokens, a request with 1,000 input tokens and 500 output tokens costs 0.056 + 0.056 = 0.112 credits. It is rounded up: you pay **0.12**.

Very small requests

On the same model, a question with 20 input tokens and a 10-token answer comes to 0.00112 + 0.00112 = 0.00224 credits. That is below the minimum, so you pay **0.01**.

The minimum matters when you make lots of small requests: 1,000 requests cost at least 10 credits, however short they are.

What costs nothing

Case	Why
Requests with a `sandbox_` key	They do not call the model and charge nothing. `usage` comes back as zero.
A `402` for lack of credits	The request never reached the model. Nothing was charged.
An image, video or voice that fails	The whole reservation goes back to your balance.

Where you see what was charged

In the Credits column of **History**, in the "Real cost" the Playground shows after each answer and in your balance, always with two decimal places.

Lots of tiny tasks, such as sorting 1,000 short sentences? Sending several in the same message avoids paying the minimum 1,000 times. See **how to prepare a large batch**.

RECOMMENDED

Want to see what each request cost? Open History.
